

For more than a decade, Emergint has delivered a wide range of healthcare-focused IT-related services that support the missions of our federal, state, and local clients. We plan, design, develop, enhance, and maintain systems (i.e., people, process, and technologies) that promote secure data exchange and collaboration and have proven their value in improving the speed and accuracy with which our customers respond to public health threats and address long-term healthcare needs of individuals and communities. Emergint supports numerous public health programs, applying our expertise to assist stakeholders in making informed decisions about their current and anticipated information management and technology requirements. Our experts work with the CDC and the programs to address some of public health's toughest problems, including the development and maintenance of surveillance and delivery components of diseases, birth defects, injury, bio-surveillance, and bioterrorism prevention. Our expertise is in the collection, integration, and management of public health and clinical data to support retrospective and prospective research. Emergint provides skilled staff in support of public health informatics, IT support service desk, software development and consultation.
